NAME
       forking-httpd – Forks new process to respond on to request.

SYNOPSIS
       forking-httpd [-h *host***] [-p** *port***] FILES ...**

DESCRIPTION
       forking-httpd This program takes in 3 options to distinguish a host
name, port number and path to the log file. Forking-httpd opens a connection
to a socket based on specified host and port if provided and listens. When a
connection is accepted a process is forked to receive the request. While the
parent process is terminated to continue listening on the socket for
connections. Once a request is received it is verified for correctness and
then responded to.

OPTIONS
       -h   host name

       -p   port number

       -l   specifies access to the log file

FILES
       Document Root to be served from.

BUGS
       My program does not use the –l function.
